

CPP_REFERENCE_INDEX

Core Definition

Index for the C++ standard library quick-reference set. Each file follows the same shape: a **Target | Operation | Output** signature table, common patterns with runnable examples, important concepts, and best practices.

#CPP #REFERENCE #INDEX #STDLIB

FILES

Requested set

File	Header	Covers
IOSTREAM_REFERENCE.md	<iostream>	Stream hierarchy, cin / cout / cerr / clog, formatted and unformatted I/O, stream state, format flags, tie/rdbuf, sentries
IOMANIP_REFERENCE.md	<iomanip> + <ios>	Every manipulator — parameterized and not. setw / setfill / setprecision, alignment, base, float format, quoted, put_time / put_money, stickiness rules, format-state RAII
FSTREAM_REFERENCE.md	<fstream>	ifstream / ofstream / fstream / filebuf, open modes and the mode matrix, positioning, binary I/O, random access, filesystem companions
CSTRING_REFERENCE.md	<cstring>	C-string and raw-memory functions, wide counterparts, the safety cheat sheet, why std::string usually wins
STRING_REFERENCE.md	<string>	std::string full member list, string_view, searching, numeric conversion, SSO, iterator invalidation, performance table
CMATH_REFERENCE.md	<cmath>	All math functions, classification, rounding, special functions (C++17), <numbers> constants, floating-point comparison, domain table
CCTYPE_REFERENCE.md	<cctype>	Character classification and case conversion, the unsigned char UB trap, the C-locale classification matrix, locale-aware <locale> alternatives
CONIO_REFERENCE.md	conio.h	Non-standard. Borland/Turbo C full set vs the MSVC subset, extended key codes, portability matrix, and portable <code>termios</code> / <code>curses</code> replacements

CONIO_REFERENCE.md is the one non-standard entry in this set — included because legacy and coursework code depends on it. Everything else here is ISO C++.

Standard I/O library (per en.cppreference.com/w/cpp/io)

File	Header	Covers
IOS_REFERENCE.md	<ios>	ios_base and basic_ios — the foundation. All flag types, state semantics, copyfmt, xalloc / iword / pword, callbacks, io_errc

File	Header	Covers
SSTREAM_REFERENCE.md	<sstream>	istreamstream/ostringstream/stringstream/stringbuf, parsing and building, C++20 view() and move-str(), tool-selection table
STREAMBUF_REFERENCE.md	<streambuf>	The buffer model, get/put areas, every protected virtual, working custom buffers (null sink, tee, prefixer, buffered in/out), char_traits
CSTDIO_REFERENCE.md	<cstdio>	FILE* I/O, full printf / scanf specifier tables, binary I/O, RAI wrapper, the classic traps, mapping to std::format
MODERN_IO_REFERENCE.md	<print> <format> <syncstream> <spanstream> <iosfwd>	C++20/23 I/O: format spec grammar, custom formatter, thread-safe output, allocation-free streams, forward declarations, removed headers

WHERE TO LOOK

Question	File
"Why does my getline read an empty line?"	IOSTREAM (the >> then getline trap)
"How do I make a column line up?"	IOMANIP (aligned table output)
"Why is my setw only working once?"	IOMANIP (stickiness table)
"What does ios::ate do vs ios::app?"	FSTREAM (open mode matrix)
"How do I read a whole file into a string?"	FSTREAM (slurp)
"Is strncpy safe?"	CSTRING (the strncpy trap)
"How do I split a string?"	STRING (splitting) / SSTREAM
"Why doesn't 0.1 + 0.2 == 0.3?"	C_MATH (comparing floats)
"Why does isalpha crash on accented text?"	CCTYPE (the cast – always)
"How do I read a key without pressing Enter?"	CONIO (portable replacements)
"conio.h won't compile on Linux"	CONIO (portability matrix)
"What's the difference between fail and bad?"	IOS (state flag decision table)
"How do I reset a stringstream?"	SSTREAM (the two-step reset)
"How do I make cout write to a socket?"	STREAMBUF (custom buffers)
"Why is my printf crashing?"	CSTDIO (printf is not type-safe)
"How do I print from multiple threads?"	MODERN_IO (osyncstream)
"How do I format my own type?"	MODERN_IO (custom formatter)
"Which header do I include in my .hpp?"	MODERN_IO (iosfwd)

STANDARD VERSION SUMMARY

C++11	move semantics on streams; string paths for fstream; getline; stoi/to_string; cbrt/hypot/round/isnan and the classification family; io_errc; scoped enums
C++14	std::quoted; ""s literals; gets removed
C++17	filesystem::path in fstream; string_view; charconv; special math functions; 3-argument hypot; clamp
C++20	std::format; syncstream; stringstream view()/move-str(); numbers constants; starts_with/ends_with; lerp; bit_cast; three-way comparison
C++23	std::print/println; spanstream; string::contains; resize_and_overwrite; ios::noreplace; range formatting
C++26	strstream removed; println(); runtime_format

COMPILER FLAGS WORTH USING

<code>-std=c++20</code>	Or c++23 where the toolchain supports it
<code>-Wall -Wextra -Wpedantic</code>	The baseline
<code>-Wformat=2</code>	Catches printf/scanf mismatches
<code>-Wshadow -Wconversion</code>	Catches quiet correctness bugs
<code>-fsanitize=address,undefined</code>	Finds the buffer and UB bugs these headers invite
<code>-D_GLIBCXX_ASSERTIONS</code>	libstdc++ bounds checks in debug builds
